Agentic AI is no longer a pilot programme. It is production infrastructure for SMEs in 2026.

Our latest research across 12 sources points to three shifts that are redefining what a small team can do. Open-source models now match enterprise-grade performance at a fraction of the cost. Multi-agent pipelines are replacing single-step automation. And MENA is emerging as an early-mover market — adoption is accelerating faster than Western Europe.

The window for competitive advantage is still open. Businesses that deploy agentic workflows now will be 12–18 months ahead of those waiting for the market to mature.

What is holding your team back from making the move?

Facebook Post

Is your business keeping up with the AI wave hitting SMEs right now?

The latest research shows that agentic AI — where multiple AI agents handle complex tasks end to end — is no longer expensive or complicated. Open-source models have closed the gap with expensive enterprise tools, and the cost of running AI has dropped 40% in the past year.

For small businesses in MENA and beyond, this is a real opportunity — not a distant one. What would you automate first if you could?

Instagram Post

AI is running businesses. Is yours one of them?

- Agentic workflows replace 3-person ops teams
- Open-source models now rival GPT-4 at 10x lower cost
- MENA is the fastest-growing AI adoption region in 2026

The tools exist. The window is open. Start now.
